

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Observations of what did præternaturally occur in the opening of the Body of Mr. Smith of Highgate, July 8th. 1687. Communicated by that learned Physitian Dr. Edward Tyson Reg. Soc. Soc.

N the first place dividing the Abdomen, immediately upon Incision made into the Peritonaum, we discovered the Bladder very Scherrous and thick, viz. 4 of an Inch; of a Præternatural Figure, and diftended to the bigness of a Child's Head: And at the entrance of the Ureters on each fide were two Protuberancies, of the bigness of a Hen's Egg each; the Ureters were of the largeness of the small Gutts in Children, so that they could easily admit two fingers into their Cavity. They were both replete with Urine or a ferous matter; which upon pressure did easily regurgitate into the Kidneys, but would not pass at all into the Bladder. The Kidneys were of their Natural bigness and Figure, but so emaciated that they were rather large Baggs than of a fleshy Substance; the Cavity of the Pelvis being so large as to contain above 3 ounces of Water: But to return to the Bladder; therein upon Apertion we discovered a very strange fort of Cystes or Bags, of the exact Figure of Eggs of feveral dimensions, some larger than Goose Eggs, others as big as Hen Eggs to the number of twelve in all; and about eight of them whole and replete with a Limpid Serum: The Coats of these Bladders were some of them considerably thick, others very thin and tender; all of them loose and free without the least adhæsion, either to one another or to the Coat of the Bladder. There was little or no Urine in the Bladder but what

what was contained in these Bags. Nor could we Imagine that this miserable Patient could possibly make any Water, but what happened upon the breach of some of these Watery Tumours, when the Bladder was crouded beyond its dimensions: for that the passage by the *Ureters* into the Bladder was impervious: And though the *Ureters* were full of *Serum*, yet could none be forced into the Cavity of the Bladder.

This Liquor contained in these Bags, we did conjecture to be of the Nutritious juice of the Body; and upon tryal of boyling a small quantity of it, we found it thicken and come to the consistence of a stiff and glutinous Gelly. These Vesiculæ were undoubtedly formed from the tenacity of the matter between the Membranes of the Bladder, in its oblique passage through them; for that being so glutinous, it was here detained till its Superficies were condensed into a firm Coat, and so by the coming of more matter was forced into the Cavity of the Bladder. This I suppose from our finding two of these Ova in a distinct Sinus from the rest, between the Coats of the Bladder, at the entrance of each Ureser.

The Liver we found very large and hard, of the Colour and Substance of a boyled one. It adhered to the *Peritonaum* on the external part, and by its vast bigness had so straitned the *Thorax*, that there was very little room for the Lungs.

The Lungs we found of a livid Colour, adhering close to the *Pleura* on the right fide; upon Incision we found them wholly repleat with a Purulent matter, and a Stone of the bigness of a Cherry-Stone in one Lobe.

Dividing the *Pericardium* we found a Fungous Substance covering the heart all over; and *Fibres* from it that rann to the *Pericardium* in a great number; so that they were by these *Fibres* every where united.

The Heart was very large, the right Auricle and Ventricle were one large undivided Cavity, and therein a large Polypus; [334]

lypus; which run up the descending Branch of the Vena Cava to the very fugular, another part was distributed to the Pulmonary Artery.

In the left *Ventricle* was another *Polypus* not so large as the former: It had two Branches, one in the *Pulmonary* Vein,

another in the Arteria Magna, or Aorta.

One of the *Veficulæ* being opened had a large cluster of small *Ova* as big as Grapes, all repleat with Liquor: All the rest contained nothing but *Serum*.

A Relation of an extraordinary effect of the power of Imagination: Communicated by Mr. Edward Smith, Secretary to the Philosophical Society at Dublin, as it was brought before that Company, by Mr. St. George Ash. R. Soc. S. who had seen the thing.

NE Elizabeth Dooly of the County of Kilkenny was aged 13 Years in January last: Her Mother being with Child of her was frighted by a Cow as she milked it, thrown down and hit on her Temple, within an eighth of an Inch of her Eye, by the Cow's Teat. This Child has exactly in that place, a piece of Flesh resembling a Cow's Teat, about 3 Inches and half in length: 'Tis very red, has a Bone in the midst about half the length of it; 'tis perforated and she Weeps through it; when she Laughs it wrincles up and contracts to two thirds of its length, and it grows in proportion to the rest of her Body. She is as sensible there as in any other part. This is lookt upon to be as strange an instance of the strength of Imagination as can be produced.
